

CallRecorder Access System

Whatever happens, you know what has been said.

Call Recorders are very efficient in automatically recording all telephone calls of your organisation. Whatever happens, you know what has been said. Because the capacity of the hard disks in the recorders is so high, the recorders generate huge databases of recorded data. The obvious tool to work with all this information is the PC. Therefore, the Call Recorder Access System was introduced: to help you to benefit most from the data acquired by your Call Recorders.

Access to the contents of the recorders

All Call Recorders are equipped with a network port. A Call Recorder gives access to recordings using the local or wide area network. If needed and with precautions to make it safe, access is possible across the internet. All Call Recorders present recordings as if they are servers on your network using the very common file transfer protocol (FTP). The function of the Call Recorder Access System is to keep track of the data in all your recorders, present them on your PC as a database and to help you to work with these data to benefit most. The database in your PC is automatically kept up to date. The most obvious function of the software is to find the recording or fragment of a recording that you need and to let you listen to it. In practice there is much more to be gained. The software allows you to explore the telephone communication of your organisation to a large extent.

Comprehensive search for recordings

The number of calls made on any business telephones system soon adds up to perhaps hundreds of thousands of recordings. The Call Recorder Access System is made to cope with this. To allow you to find your recordings quickly the Access System offers a very easy to use query mechanism. Just open the query screen and enter your search criteria. This will reduce your selection as you add criteria and you are likely to find precisely that discussion that you were looking for in a matter of minutes or even seconds.

CallRecorder Access System

- PC Software for access to Call Recorders
- The solution to manage massive recording databases
- Direct playback on the PC from remote recorders
- Presents graphical analyses of call data
- Works with Crypto Card
- Can display recorded fax transmissions
- Automated back-up system for Call Recorders
- Many other functional tools

Security

Data security is built into Call Recorders to a large extent. Dependant on model, the level of access to a recorder that a user has can be restricted to include only certain types of recordings. PC access is restricted in the same way. When an even higher level of security than based on passwords is required the so-called Crypto Cards are used.

A Crypto Card is an IC card that can be placed in the card reader of the recorder. Recordings that are made using a Crypto Card are in encoded format and cannot be listened to without a Crypto Card of the same set. The Call Recorder Access System supports the use of an IC Card Reader for the PC and can play the Crypto Card encoded recordings or can convert them to generic audio formats. In this way, the Call recorders and the software can offer a high level of security without any inconvenience.
